

GEMMER

GEnome-wide software for Multi-
 scale Modeling data Extraction and
 Representation

Multi-scale modeling

- the term multi-scale is to be used when all of these aspects (**functional, temporal and spatial separation**) are present and key to understanding a single overarching biological process.
- “... multi-scale models is a composition of two or more single scale models representing the same phenomenon (or its parts) at different levels of descriptions” (Castiglione et al., 2014).

Why GEMMER

- For multi-scale modeling purposes it is useful to:
 - Find *proven interactions* between proteins
 - Know what the *function* of these proteins is
 - The function indicates some characteristic *time-scale*
 - Know what types of interactions these are: *physical*, *genetic* or *regulation*?
 - Know the *expression levels* and *localization* of the proteins
 - How many experiments, publications and methods have shown the interactions
 - *Visualize* these in a network
 - *Export* the data for later use

What GEMMER provides

- GEMMER aids (modeling) research by providing
 - Effortless **data-integration** from 3 databases
 - SGD, CYCLOPS and the GFP database
 - Interaction networks with localization and expression information incorporated
 - Centered around 1 or more proteins
 - Data **visualization** using interactive D3 (*not 3D!*) drawings
 - With various filtering possibilities
 - Data **export** for **interaction networks** to SVG & Excel

What GEMMER provides: visualization

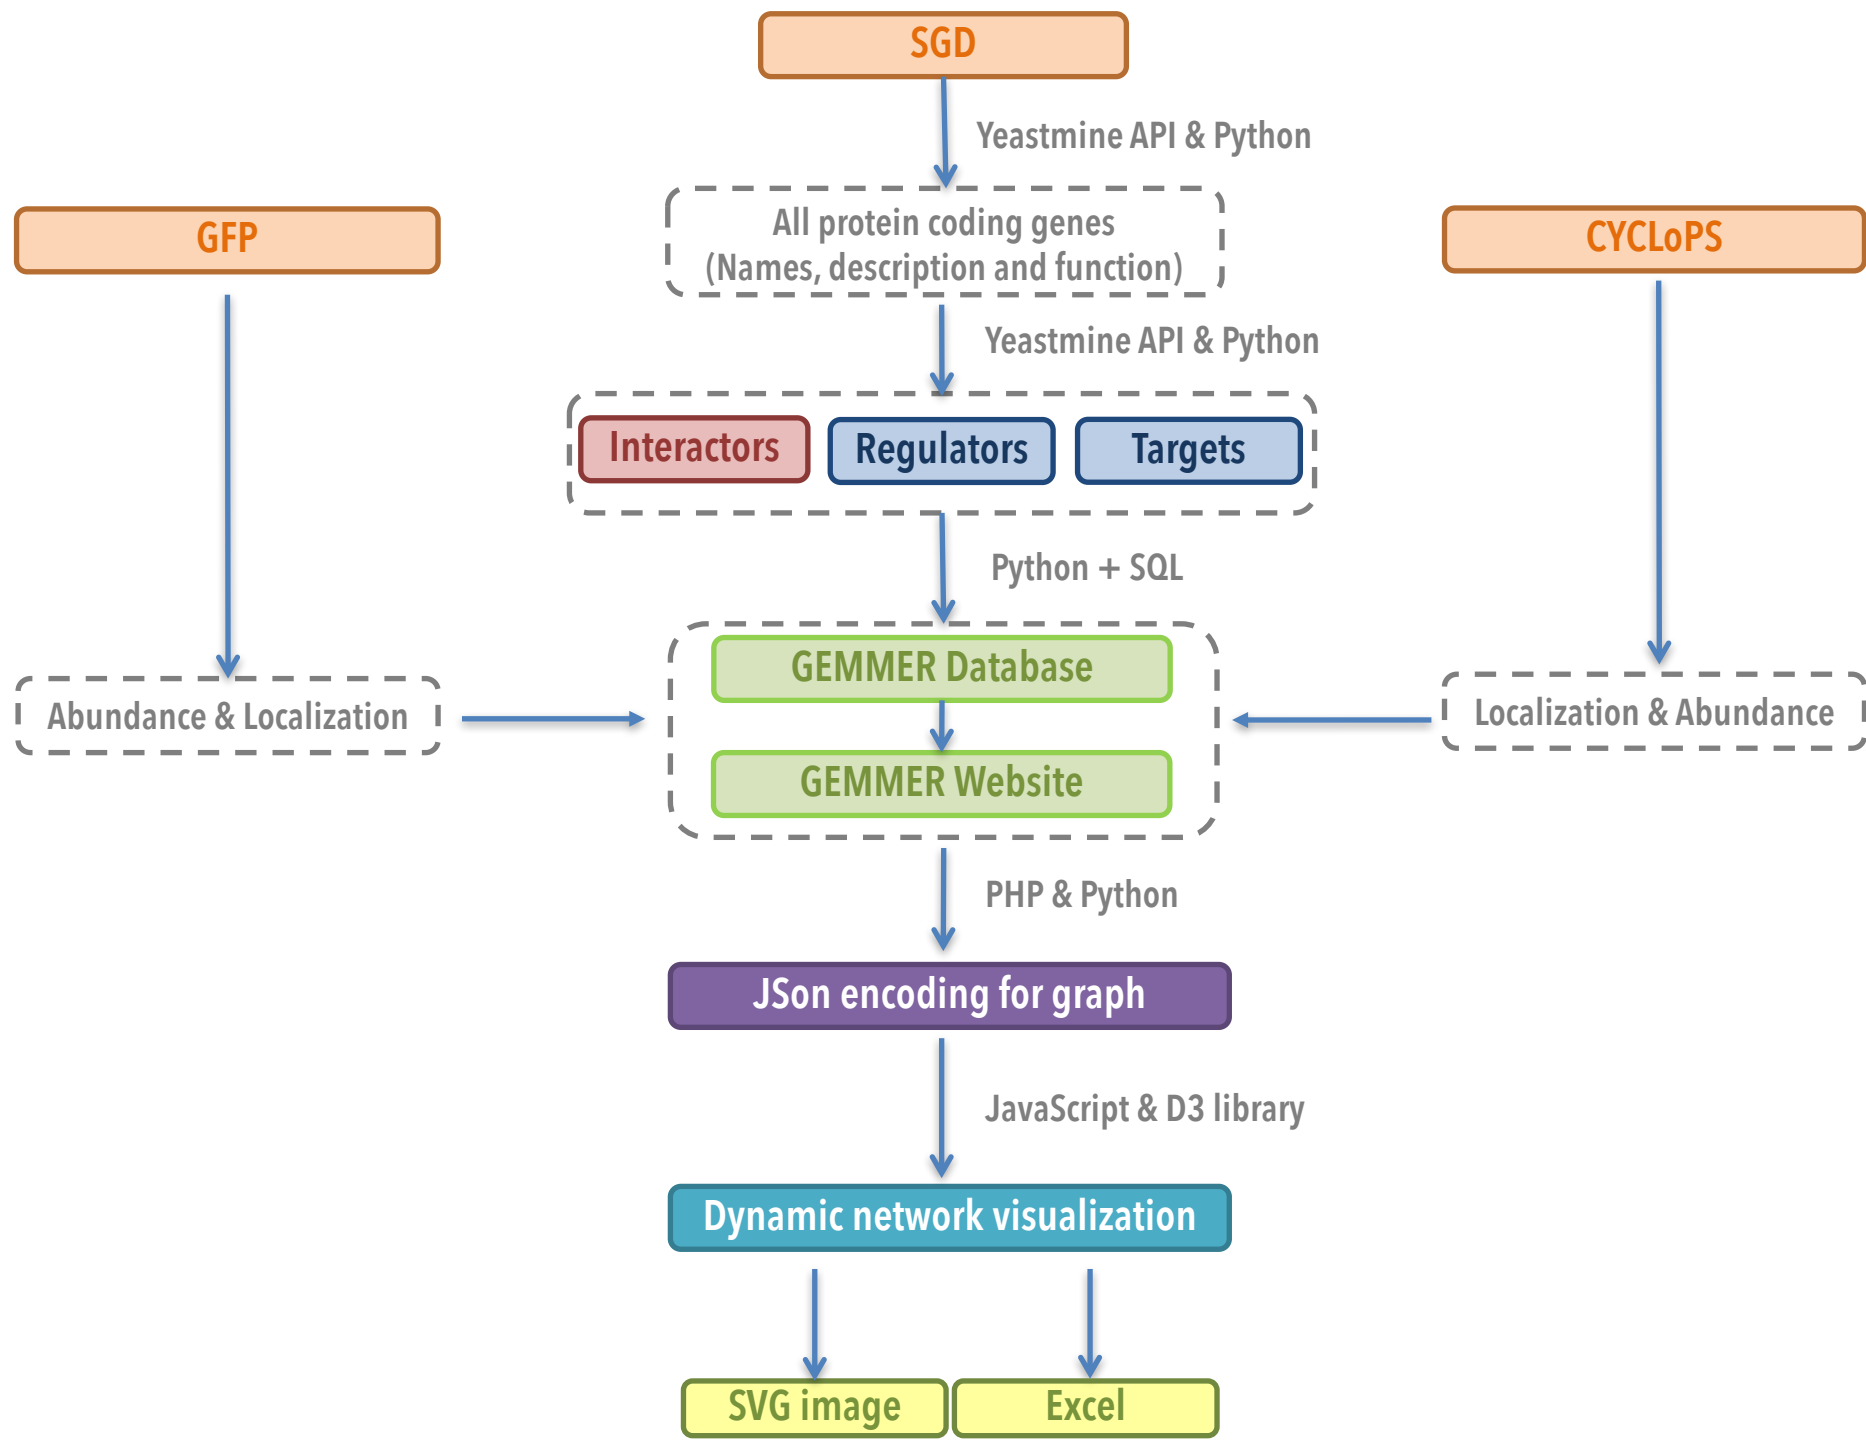

- Visualization options available in GEMMER
 - Interaction networks joining up to 3 or more genes
 - Clustering
 - Cluster the network on its dominant compartment (CYCLOPS expression) or function
 - Coloring
 - Color the nodes based on function through GO annotations or dominant compartments
 - Filtering
 - Decide what the lower bounds on the number of experiments, publications or experimental methods is
 - Select only genes that are expressed in specific compartments according to either CYCLOPS or GFP

Comparison to existing tools

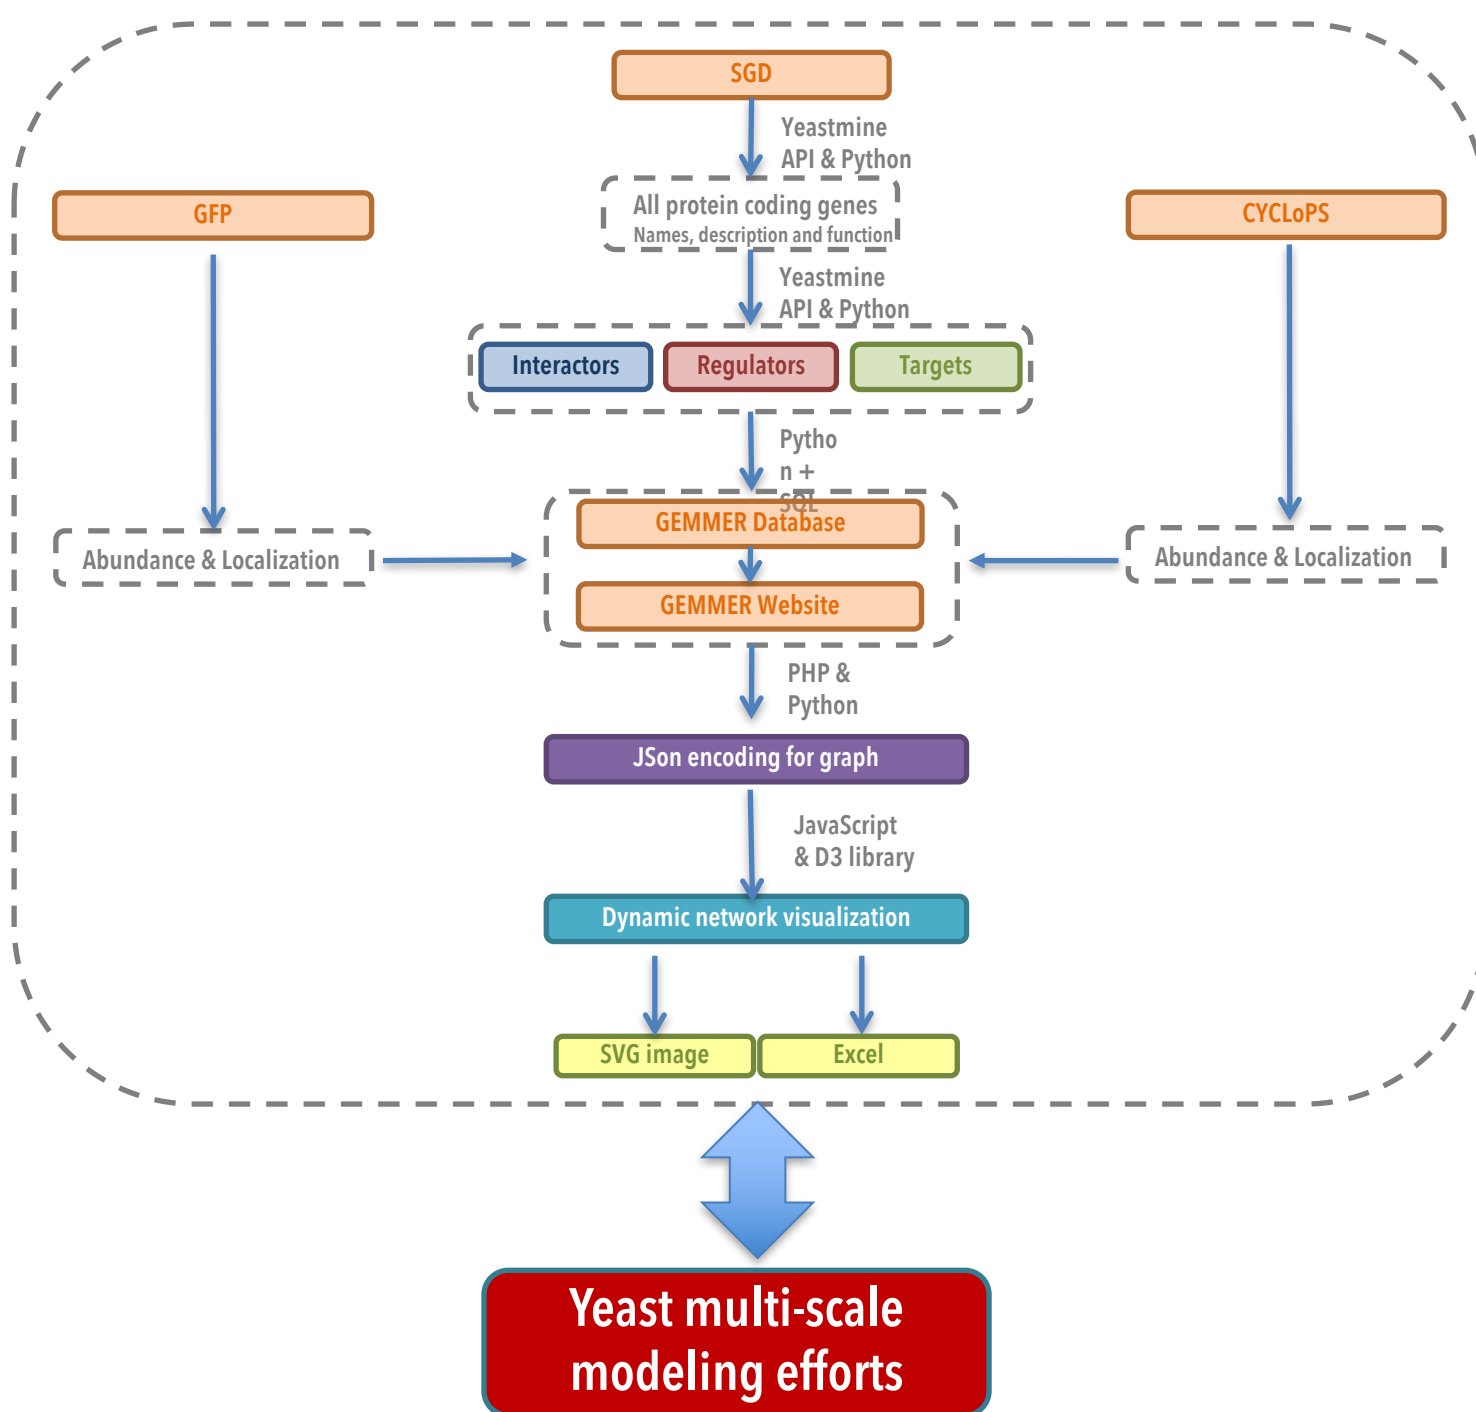

Features	GEMMER	STRING	BioGRID	APID	Arabidopsis Interactions Viewer	IntACT
Yeast specific and genome-wide	X					
Node size proportional to interactions in the visualized network	X		X			
Edge size proportional to interactions in the visualized network	X		X	X	X	
Coloring nodes by their GO-term annotated function: cell cycle, metabolism, signal transduction, DNA replication	X	X		Manually	X	
Visualizing both genetic and physical interactions and being able to filter out one of the two	X	X	X			
Showing interactions only if at least n experiments have shown an interaction	X	X*		X		
> n unique experimental methods	X					
multi-node	X					
Clustering nodes on function (GO-term)	X		X ***	X	X	
Incorporating localization information from the CYCLOPs database (Koh et al. 2015) and the GFP database (Ghaemmaghami et al. 2002) and being able to colour/cluster on it	X					
SVG + Excel export	X	X	X		X	

How GEMMER works (technical)

- GEMMER is built on common open-source software
 - Runs on a VPS (virtual private server)
 - Website based on Bootstrap framework
 - All information integrated in an SQL database
 - Python scripts perform the interfacing with the SQL database to generate networks
 - PHP to serve results to the user
 - Visualizations based on D3js (Data-Driven Documents Javascript)

Function prediction

- What does a specific protein do functionally?
- This is a **hard** question
- **GEMMER "solves" this by using SGD's GO annotations**

Biological Process 7 entries for 3 Gene Ontology terms

Gene Ontology Term	Qualifier	Evidence	Source	Assigned On	Annotation Extension	Reference
regulation of cyclin-dependent protein serine/threonine kinase activity		IEP	SGD	2002-03-21		Schwob E, et al. (1994) PMID:7954792
regulation of cyclin-dependent protein serine/threonine kinase activity		IMP	SGD	2002-03-21		Schwob E, et al. (1994) PMID:7954792
regulation of cyclin-dependent protein serine/threonine kinase activity		IPI	SGD	2002-03-21		Schwob E, et al. (1994)

What does this mean?

Function prediction

- GEMMER uses SGD GO annotations to predict functionality of a Gene in the **categories**:
 - Cell cycle
 - Cell division
 - Signal transduction
 - DNA replication
 - Metabolism
- This is done by assigning all annotated GO terms to one of these as a **parent** of the more specific GO term
- The two most abundantly annotated of these 5 are saved as GO term 1 and GO term 2

GO annotations exist in trees with “children” and “parents”

The database

Aside from visualization all info in the database can be searched and interacted with

GEMMER GEnome-wide software for Multi-scale Modeling data Extraction and Representation v0.7

[Home](#)[News](#)[Documentation](#)[Database](#)[Github repository](#)[Contact](#)

We currently have the following genes from SGD stored.

Standard name	Systematic name	Name description
AAC1	YMR056C	Mitochondrial inner membrane ADP/ATP translocator
AAC3	YBR085W	Mitochondrial inner membrane ADP/ATP translocator
AAD10	YJR155W	Putative aryl-alcohol dehydrogenase
AAD14	YNL331C	Putative aryl-alcohol dehydrogenase
AAD15	YOL165C	Putative aryl-alcohol dehydrogenase
AAD16	YFL057C	Putative aryl alcohol dehydrogenase
AAD3	YCR107W	Putative aryl-alcohol dehydrogenase
AAD4	YDL243C	Putative aryl-alcohol dehydrogenase
AAD6	YFL056C	Putative aryl-alcohol dehydrogenase
AAH1	YNL141W	Adenine deaminase (adenine aminohydrolase)
AAP1	YHR047C	Arginine/alanine amino peptidase
AAR2	YBL074C	Component of the U5 snRNP complex
AAT1	YKL106W	Mitochondrial aspartate aminotransferase
AAT2	YLR027C	Cytosolic aspartate aminotransferase involved in nitrogen metabolism
ABD1	YBR236C	Methyltransferase
ABF1	YKL112W	DNA binding protein with possible chromatin-reorganizing activity
ABF2	YMR072W	Mitochondrial DNA-binding protein

Example visualization: 1 protein (Sic1)

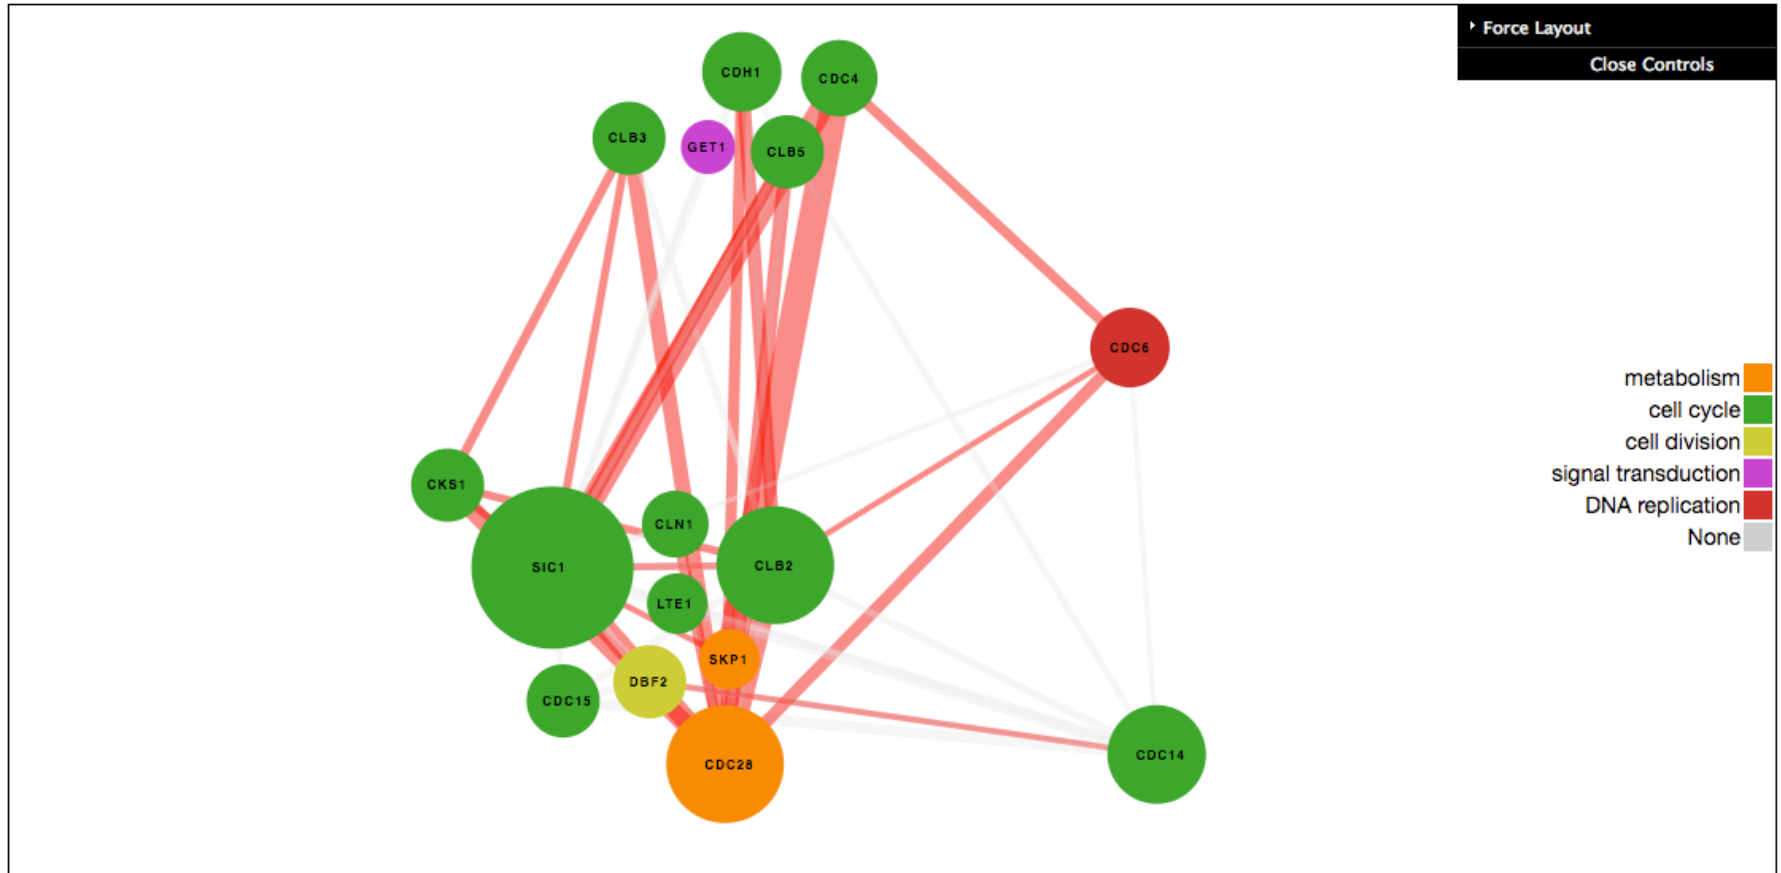

Any interaction type, minimally 4 experiments in at least 3 papers with at least 2 different methods.

Example visualization: 1 protein (Sic1)

Note the clustering and coloring. Here the clustering indicates the compartment in the WT1 experiment of the CYCLOPS database where this protein is found most abundantly.

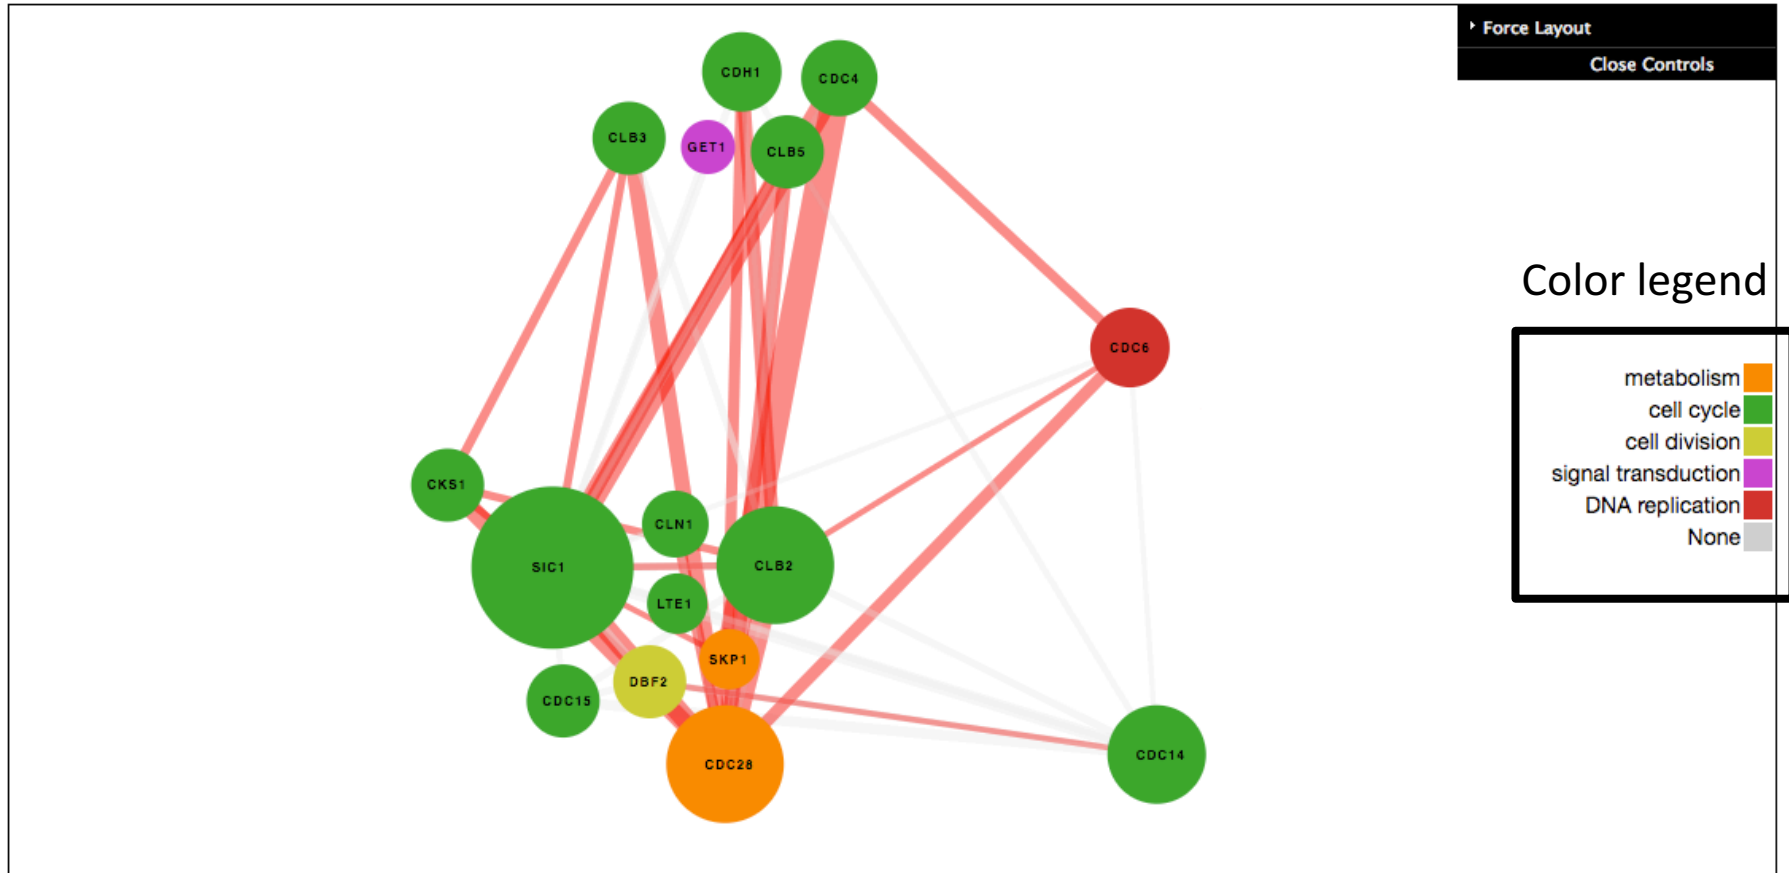

The coloring indicates its likely dominant function based on GO term annotation.

Example visualization: 1 protein (Sic1)

Note the clustering and coloring. Here the clustering indicates the compartment in the WT1 experiment of the CYCLOPS database where this protein is found most abundantly.

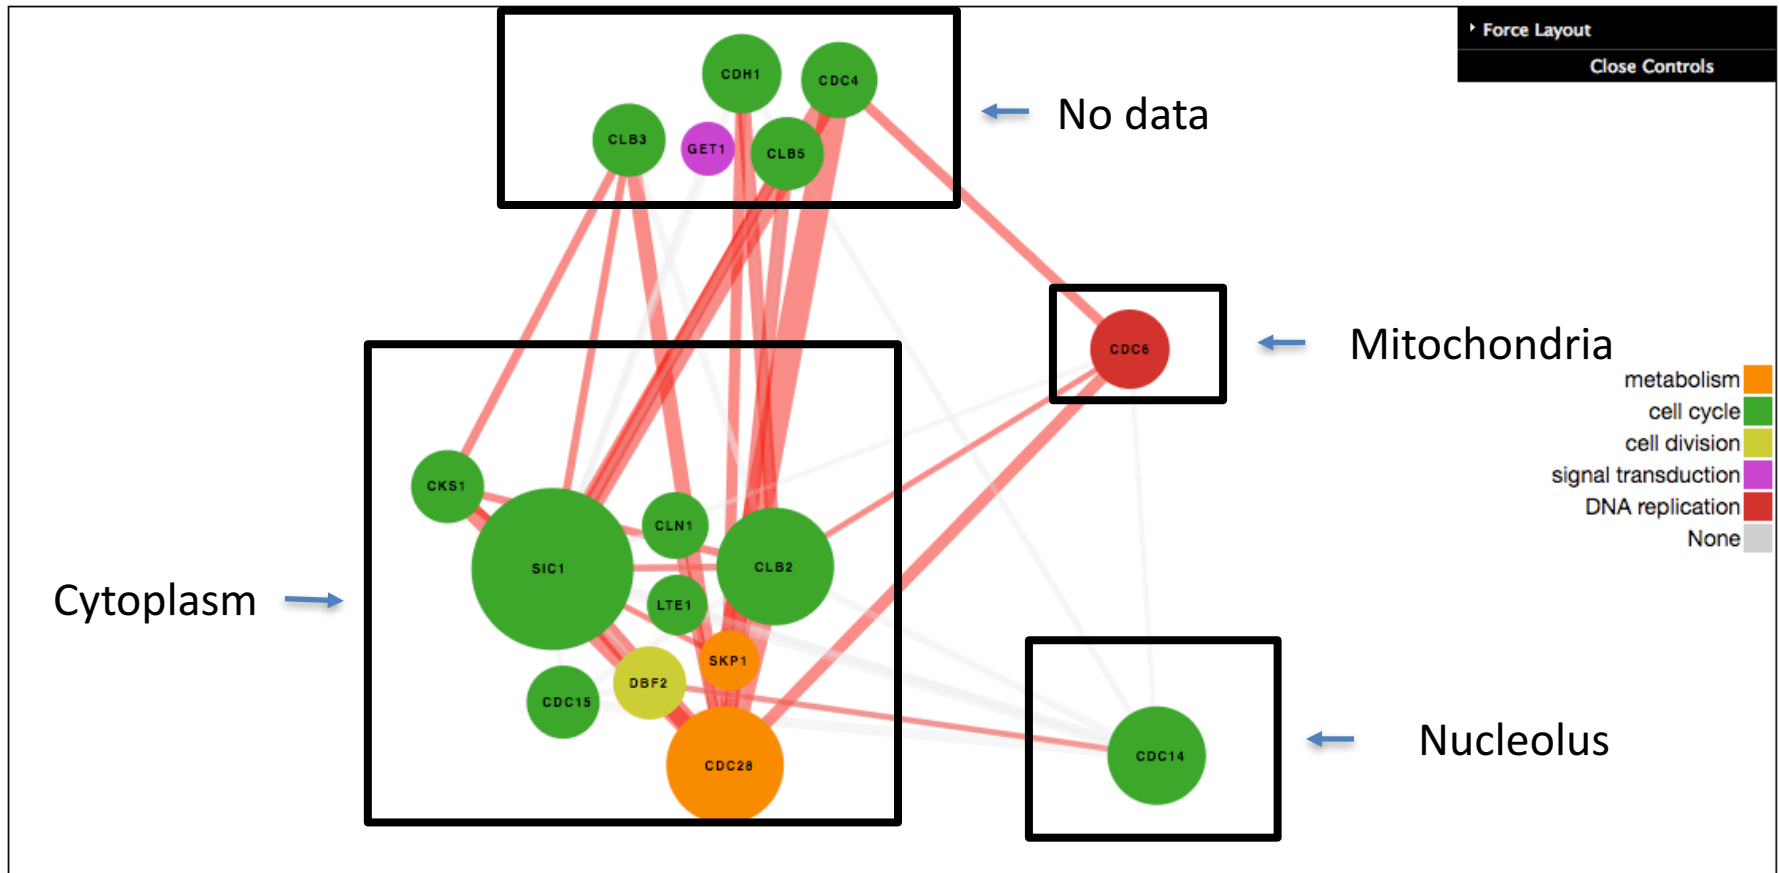

The **coloring** indicates its likely dominant function based on GO term annotation.

Example visualization: 1 protein (Sic1)

Note the clustering and colouring. Here the **clustering** indicates the compartment in the WT1 experiment of the CYCLOPS database where this protein is found most abundantly.

The coloring indicates its likely dominant function based on GO term annotation.

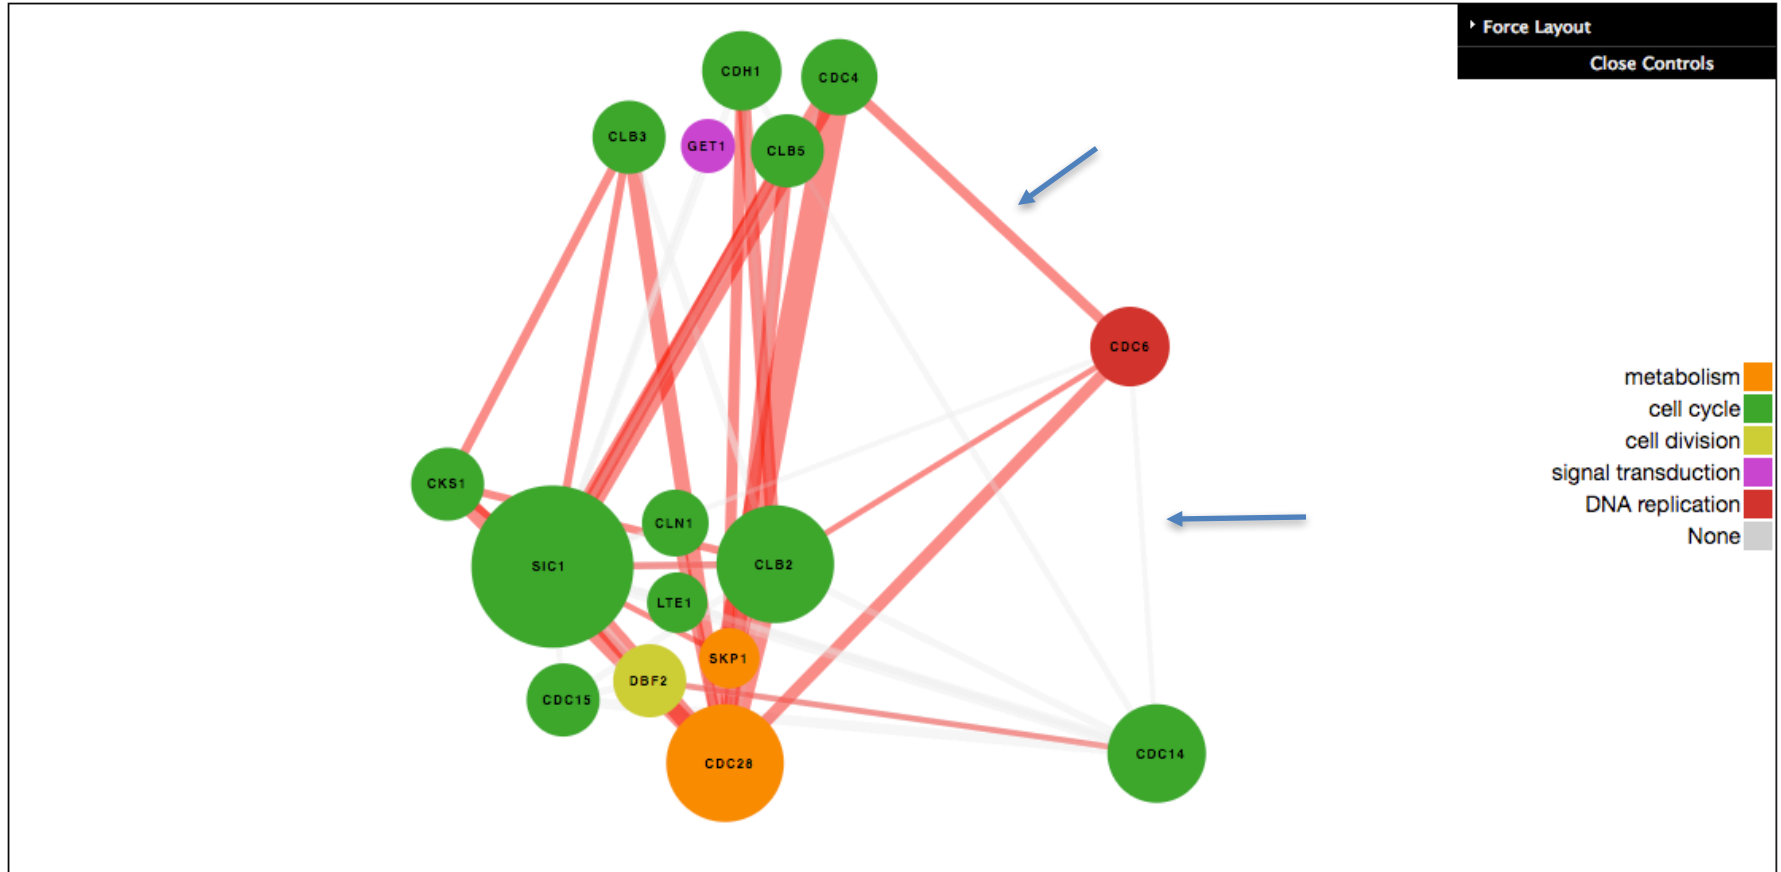

Example visualization: 1 protein (Sic1)

Interactions are colored according to the interaction type:

- Physical
- Genetic
- Regulatory

Thickness is proportional to the number of experiments supporting this interaction

Example visualization: 1 protein (Sic1)

Node size is proportional to the number of interactions in the current network.

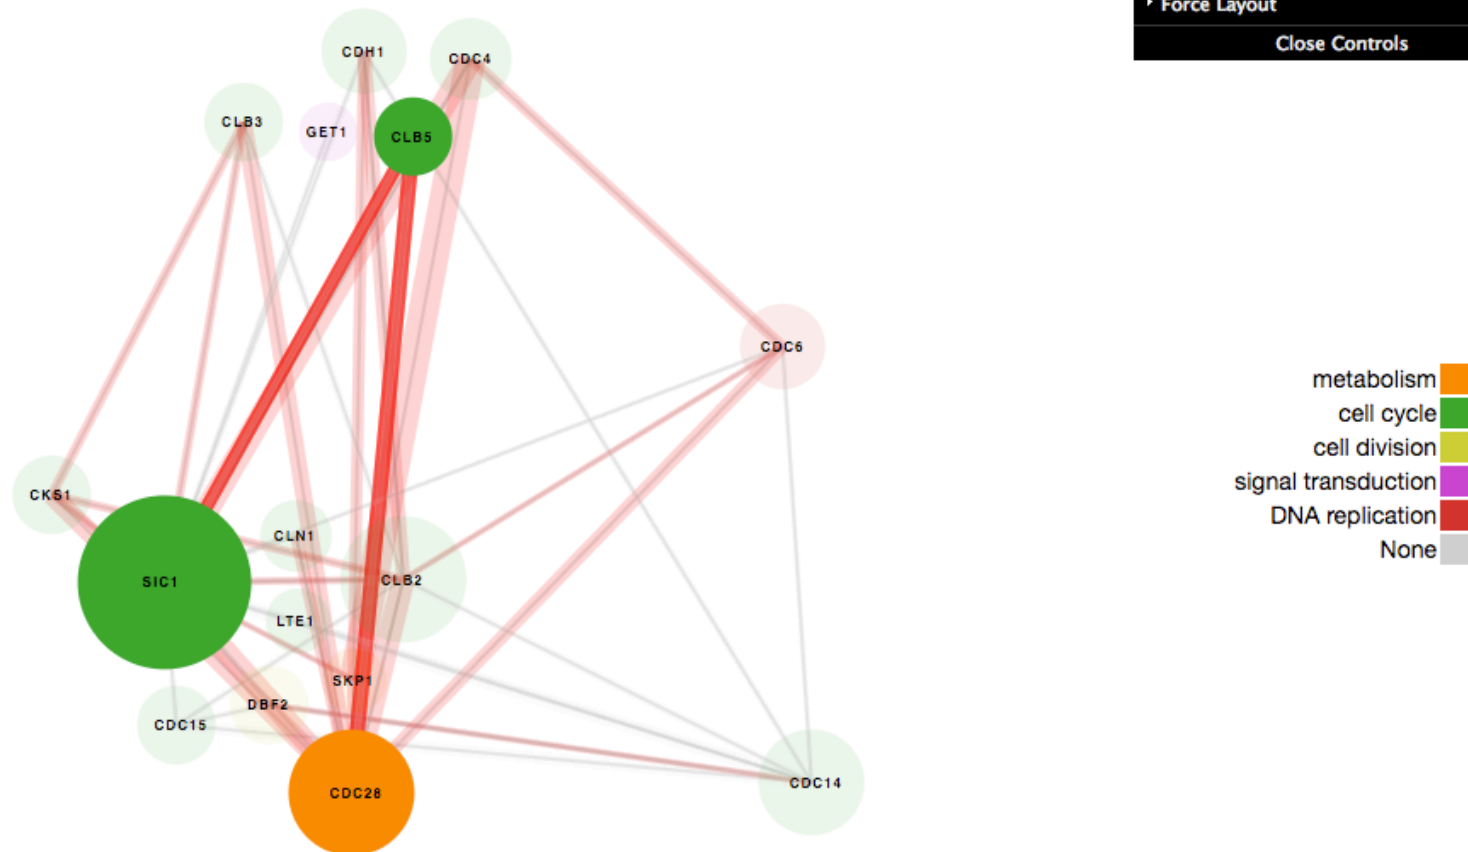

Notice that Sic1 is the biggest, since it is the *generator protein* for this network (it interacts with all nodes by design)

Example visualization: 1 protein (Sic1)

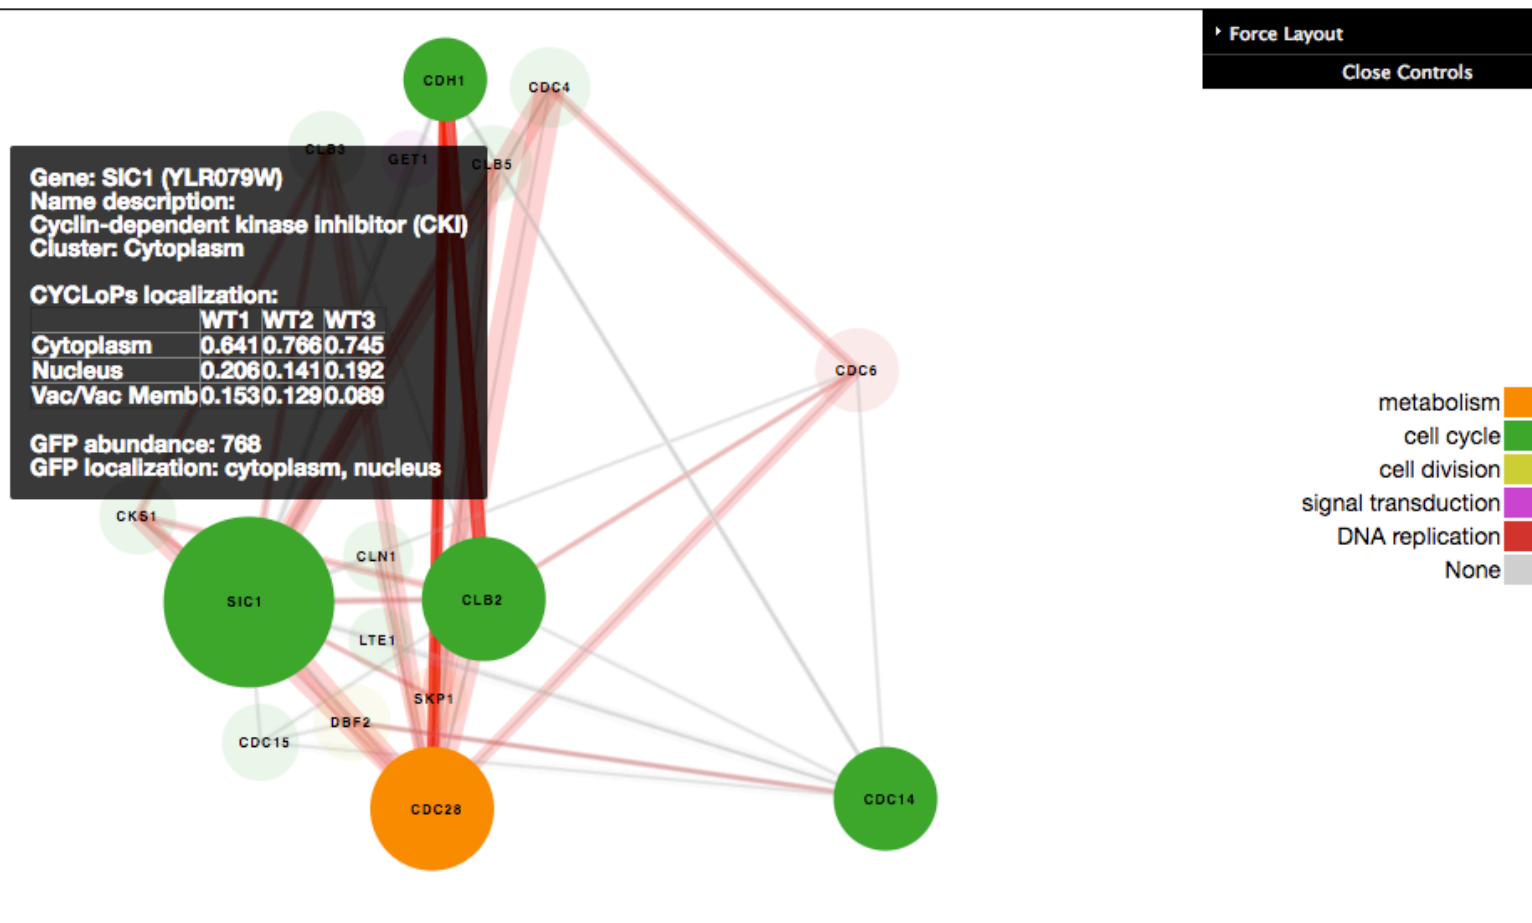

Clicking a node highlights its connections in the network

Focus on CLB5 for instance

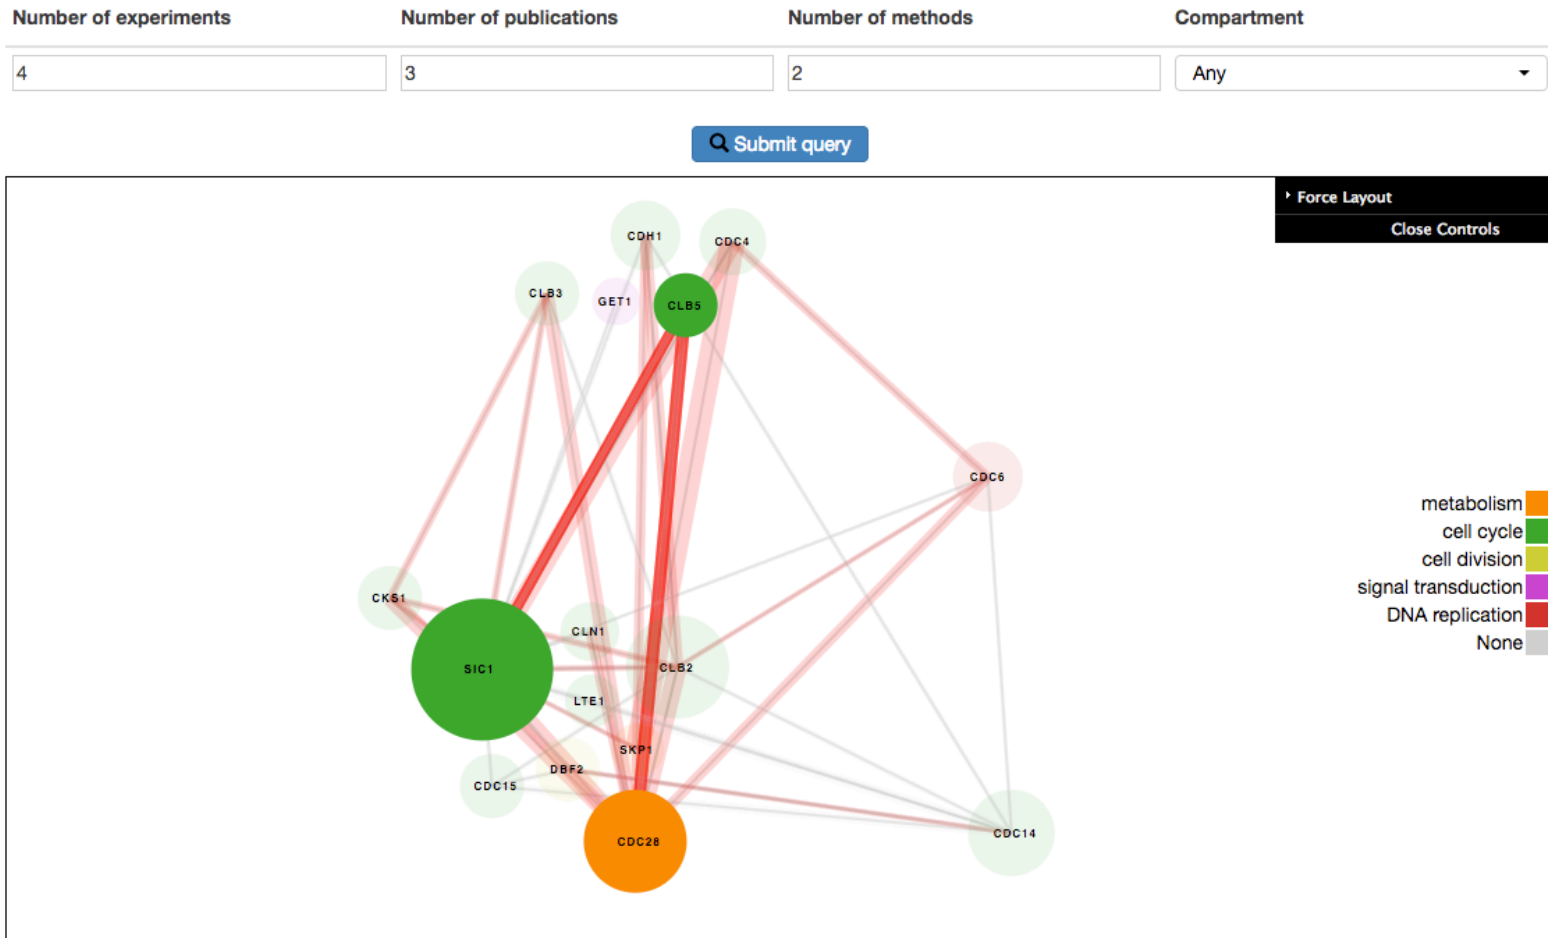

Example visualization: 1 protein (Sic1)

Upon hovering over a protein popup information appears

Example workflow for model-building

Still to come in GEMMER > 1.0

- Increase and improve clustering and coloring:
Add GFP options, or 'None' option
- Multiple layouts: more D3 layouts, hive plots etc.
- Generate mathematical analyses of the generated networks
- Implement of the periodic expression data from Tu et al. and the SCEPTRANS database
 - Dynamic visualization of level of expression during cell cycle progression
- Integration information from KEGG (especially for metabolic proteins)
